

Incidence Analysis Dashboard Report

January 2025 – April 2026

EXECUTIVE SUMMARY

This analysis examines patterns of violence, abuse, harassment, and community distress incidents reported across selected regions in Nigeria between January 2025 and April 2026. The objective of the analysis is to identify high risk locations, vulnerable demographic groups, severity patterns, and intervention needs that may support NGOs, humanitarian organizations, and community safety stakeholders in making informed response decisions.

A total of **1,120 incidents** were analyzed across multiple locations and reporting channels.

KEY FINDINGS

1. Most Common Incident Types

The analysis revealed that **Domestic Violence** recorded the highest number of reported incidents, followed by **Sexual Assault** and **Harassment**. Child Abuse cases represented a smaller proportion of total incidents but maintained disproportionately high severity levels.

This suggests that domestic and interpersonal violence remain major contributors to community distress and social vulnerability.

2. Geographic Hotspot Analysis

Hotspot analysis identified **Kaduna, Lagos, Uyo, Ibadan, and Port Harcourt** as locations with the highest concentration of reported incidents.

Several of these locations also recorded elevated Critical severity cases, indicating that incident volume alone may not fully represent risk intensity. Some regions with moderate reporting volumes still demonstrated high severity distributions.

This highlights the importance of combining hotspot analysis with severity analysis when prioritizing intervention efforts.

3. Severity and Risk Analysis

The data set shows a significant concentration of incidents within the **Critical** and **High** severity categories. This indicates that many reported cases involve urgent safety concerns requiring immediate intervention, protection services, or emergency support.

Children and teenagers recorded a notably high proportion of Critical severity incidents relative to their reporting volume, reinforcing concerns around child protection and vulnerability.

4. Gender and Demographic Vulnerability

Females accounted for approximately **80% of reported victims**, suggesting that women remain disproportionately affected across multiple incident categories, particularly Domestic Violence and Sexual Assault.

Adults and Young Adults represented the largest affected demographic groups overall. However, Child and Teen categories showed higher severity concentration, suggesting increased exposure to high-risk abuse situations.

5. Perpetrator Relationship Insights

The analysis revealed that many incidents involve perpetrators who are socially or personally connected to victims, including:

- relatives,
- Guardians,
- neighbors,
- intimate partners,

- employers,
- and colleagues.

This suggests that many forms of violence and abuse occur within familiar or trusted environments rather than through stranger-related encounters alone.

6. Reporting Channel Analysis

The Mobile App recorded the highest reporting usage, followed by Dashboard, Community Center, and Hotline reporting channels.

This may indicate increasing acceptance of digital reporting systems and the importance of accessible, low barrier reporting mechanisms for vulnerable individuals.

At the same time, the continued use of Community Centers and Hotlines suggests that offline and human assisted reporting channels remain important for inclusivity and accessibility.

DATA AVAILABILITY AND REPORTING LIMITATIONS

Several limitations should be considered when interpreting the findings:

- The dataset may not fully reflect the true scale of violence and abuse incidents due to underreporting.
- Some victims may avoid reporting because of fear, stigma, lack of trust in institutions, or safety concerns.
- Reporting accessibility varies across regions and demographic groups.
- Certain locations may appear to have lower incident rates due to reduced reporting access rather than lower occurrence levels.
- The dataset represents reported incidents only and may not capture unreported community distress cases.

Additionally, the dataset was developed for analytical and hackathon simulation purposes and should not be interpreted as official national crime statistics.

JUSTIFICATION FOR SELECTED STATES

The selected locations were intentionally chosen to ensure balanced representation across multiple geopolitical and socio-economic regions within Nigeria.

The distribution includes:

- urban and semi urban environments,
- northern and southern regions,
- high population centers,
- and communities with varying levels of reporting accessibility.

The selected states also provide:

- geographic diversity,
- cultural representation,
- balanced hotspot simulation,
- and broader analytical coverage for trend analysis and intervention modeling.

This approach improves the realism and diversity of the dataset while supporting more representative dashboard insights and AI/ML experimentation.

RECOMMENDATIONS

Based on the findings, the following recommendations are proposed:

i. **Strengthen Early Intervention Systems**

High severity incidents involving children, teenagers, and domestic violence victims require faster intervention pathways and protective response systems.

ii. **Improve Community Reporting Accessibility**

Expand low barrier reporting channels such as mobile reporting, hotline systems, and community-based support centers to encourage safer and more consistent reporting.

iii. Increase Awareness and Trust Building

Public awareness campaigns and survivor protection initiatives may help reduce fear related underreporting.

iv. Prioritize High Risk Locations

Locations with consistently high incident concentrations and severity levels should receive increased NGO monitoring, counseling support, and emergency response resources.

v. Enhance Data Collection and Validation

Organizations should improve data standardization, periodic validation, and incident categorization processes to support more reliable long-term analysis and forecasting.

CONCLUSION

The analysis demonstrates that violence, abuse, and community distress incidents remain significant social challenges across multiple regions and demographic groups. The findings highlight the importance of combining hotspot analysis, severity monitoring, demographic vulnerability assessment, and accessible reporting systems to support earlier intervention and more informed humanitarian response strategies.

The dashboard further illustrates how data analytics can support community safety intelligence, improve visibility into emerging risk patterns, and assist organizations in prioritizing intervention efforts more effectively.
